Venue: Room 102, SCMS

## Abstract:

A general curve $C$ of genus 6 can be embedded into the unique quintic del Pezzo surface $\mathrm{X} \_5$ as a divisor of class $-2 \mathrm{~K}_{-}\left\{\mathrm{X} \_5\right\}$. This embedding is unique up to the action of the symmetric group S_5. Taking a double cover of X_5 branched along C yields a K3 surface Y. Thus the K-moduli spaces of the pair ( $\mathrm{X} \_5, \mathrm{cC}$ ) can be studied via wall-crossing and by relating them to the Hassett-Keel program for C and the HKL program for Y . On the other hand, $\mathrm{X} \_5$ can be embedded in $\mathrm{P}^{\wedge} 1$ \times $\mathrm{P}^{\wedge} 2$ as a divisor of class $\mathrm{O}(1,2)$, under which $-2 \mathrm{~K} \_\mathrm{X}$ is linearly equivalent to O _ $\mathrm{X}(2,2)$. One can study the VGIT-moduli spaces in this setting. In this talk, I will compare these four types of compactified moduli spaces and their different birational models given by wall-crossing.
